Table S3. Associations of circulating inflammatory cytokines with liver cancer according to Mendelian randomization analysis.....	6
Table S4. Associations of inflammatory traits with liver cancer (UKBB) according to Mendelian randomization analysis.....	13

Table S1. GWAS information for eight immune-mediated diseases.

Chronic immune-mediated disease	PMID	Case number	Sample size	SNPs passing QC	Web source*	GWAS information			GWAS analysis
						Source of study population	Case definitions		
Asthma	32296059	64,538	303,859	9,572,556	GCST010042	The UK Biobank cohort	Doctor diagnosed asthma, International Classification of Diseases version-10 (ICD10) J45 (asthma)/J46 (severe asthma), and self-reported asthma		A GWAS analysis was performed with BOLT-LMM v2.3.2 using a standard (infinitesimal) mixed model to correct for structure due to relatedness, ancestral heterogeneity, with adjustment for age, sex, the first 20 principal components, and genotyping array
Rheumatoid arthritis	33310728	14,361	58,284	13,108,512	GCST90013534	18 studies of Europeans	NR		Associations of SNPs with rheumatoid arthritis were evaluated by logistic regression models assuming additive effects of the allele dosages including top 5 or 10 principal components as covariates (if available) using mach2dat v.1.0.16
Type 1 diabetes	34012112	18,942	520,580	62,116,689	GCST90014023	19 studies of Europeans	NR		The authors tested variants with $MAF > 1e-5$ for association to T1D with Firth bias reduced logistic regression using EPACTS (https://genome.sph.umich.edu/wiki/EPACTS) for non-UK Biobank cohorts or SAIGE (version 0.38) for the UK Biobank, using genotype dosages adjusted for sex and the first four ancestry PCs.
Psoriasis	23143594	10,588	33,394	111,236	GCST005527	5 studies of Europeans	NR		The GWAS data sets underwent quality control as previously described and were analyzed for association using the top principal components from the previous analyses as covariates
Crohn's disease	28067908	12,194	40,266	9,560,910	GCST004132	a UK cohort	diagnosed using accepted endoscopic, histopathological and radiological criteria		The authors tested for association with ulcerative colitis, Crohn's disease and IBD separately within the sequenced samples and new GWAS using

								SNPTEST v2.5, performing an additive frequentist association test conditioned on the first ten principal components for each cohort.
Ulcerative colitis	28067908	12,366	45,975	9,578,670	GCST004133	a UK cohort	diagnosed using accepted endoscopic, histopathological and radiological criteria	The authors tested for association with ulcerative colitis, Crohn's disease and IBD separately within the sequenced samples and new GWAS using SNPTEST v2.5, performing an additive frequentist association test conditioned on the first ten principal components for each cohort.
Celiac disease	20190752	4,533	15,283	292,387	GCST000612	an European cohort	Affected celiac individuals were diagnosed according to standard clinical, serological and histopathological criteria, including small intestinal biopsy	Analyses were performed using PLINK v1.07, mostly using the Cochran-Mantel-Haenzel test.
Multiple sclerosis	24076602	14,198	38,582	161,311	GCST005531	International Multiple Sclerosis Genetics Consortium (IMSGC)	NR	The authors applied logistic regression, assuming a per-allelic genetic model for each data set, including the first five principal components as covariates to correct for population stratification, and then performed an inverse variance meta-analysis of the 11 strata under a fixed-effects model, as implemented in PLINK
Systemic lupus erythematosus	26502338	5,201	14,267	644,674	GCST003156	From southern Europe, matching the Spanish, Italian and Turkish cases with controls from the same countries.	Diagnosed on the basis of standard American College of Rheumatology (ACR) classification criteria	All case-control analysis was carried out using the SNPTEST algorithm; we used a standard threshold of $P = 5 \times 10^{-8}$ for reporting genome-wide significance throughout. The inverse variance method was used for meta-analysis.

Periodontitis	31235808	17,353	45,563	>8,900,000	GCST008300	17,353 European and Hispanic/Latino ancestry cases, 28,210 European and Hispanic/Latino ancestry controls in the GLIDE consortium	For periodontal status, participants were classified as having (cases) or not having (reference) clinical symptoms of periodontitis, using definitions applied by each participating cohort.	For the binary trait of periodontitis, age, age-squared and other study-specific covariates were instead included as covariates in association tests. Every genotyped and imputed SNP was tested for association with these transformed variables using linear regression and additive genetic models, implemented via several software tools
---------------	----------	--------	--------	------------	------------	---	--	---

*All GWAS summary data were downloaded from GWAS Catalog. NR, not report.

Table S2. GWAS information for circulating inflammatory biomarkers.

Biomarker name	PMID	Sample size	SNPs passing QC	Study populations	GWAS information	Web source
C-reactive protein	33462484	362,443	801,7993	The UK Biobank cohort	The authors employed a GWAS with covariates of the population-specific PCs and the genotyping array on the residuals computed above. Variants were the full set of HRC-imputed SNPs in the version 3 UK Biobank data release.	Footnotes1
Eosinophil count		172,275				GCST004606
Leukocyte count		172,435				GCST004610
Basophil count		171,846				GCST004618
Lymphocyte count	27863252	~ 2,500,000		The UK Biobank and INTERVAL studies	The authors performed a univariable GWAS for each of the 36 blood cell indices that had phenotype data measured or derived in all three studies. Specifically, we computed the association statistics (i.e an estimate of the regression coefficient and the corresponding standard error) for a mixed linear regression of phenotype on the probabilistic imputed allele dose (i.e., an additive model) separately for each of the three datasets using BOLT-LMM v2.2 (Loh et al., 2015). The linear mixed model accounts for the genetic component of phenotypic correlation generated by relatedness. In order to maximize protection against confounding by large scale relatedness, we included a dummy variable for each recruitment center and the first ten PCs of the study specific kinship matrices as covariates in each regression model.	GCST004627
Monocyte count		171,643				GCST004625
Neutrophil count		170,721				GCST004629
		170,702
