¹ Mean (\pm SEM) normalised gene expression for each treatment-timepoint combination is presented (n=6 per treatment per timepoint). Treatments which do not share the same letter (a, b, c, d) are significantly different ($P < 0.05$).

² Model used for the permutation ANOVAs was $\text{gene} \sim \text{experiment} + \text{treatment} + \text{timepoint} + \text{treatment} \times \text{timepoint}$
