***Number of items proposed to be removed based on MSA: None

Measure of Sampling Adequacy (MSA): Values of MSA below 0.50 suggest that the item does not measure the same domain as the remaining items in the pool, and so that it should be removed.

Relative Difficulty Index (RDI): it assesses the position of the items. For a normal-range test, an optimal pool of items should have about 75% RDI values between .40 and .60 and the remaining values evenly distributed in both tails.
